We are finding once again that congress has the ability to do what is best for the people and not for their wallets. I live in a very small town and own XM Satellite radio. For the last two years I have been able to listen to modern music, stay current on world events, and most of all feel connected to the outside world. What advantage does the NAB get by trying to squash XM road conditions and up to the minute weather conditions? This service is only going to help the radio consumer. Why differentiate between satellite radio and regular radio when it comes to the listener's safety? I implore you to do the right thing and think of the safety of the drivers first and allow XM to inform drivers of unexpected weather and driving conditions.

Sincerely,
J. Michael Neener
